

Step Functions (Standard) Workflow — 1 execution = 1 Removal Request

AWS Step Functions — Standard Workflow

-  Use Intoxalock's existing service-center database (locations, contacts, hours) — not a new build
-  one-time upfront extraction enriches the DB with missing hours
-  spike: validate feasibility via Google Places API / scraping
-  Service Center confirms / corrects hours via the Confirmation Page (email or SMS)

WHAT THIS FIXES vs. TODAY

✓ FIXED — the customer can now request removal through several channels — app, SMS, or phone call — and gets a quick response on every one.

✓ FIXED — device removal appointments are confirmed automatically, and no Intoxalock representative involvement. A representative steps in only on edge cases where the service center and customer cannot reach an agreement.

✓ FIXED — the system keeps the customer informed of their request status on a regular cadence, reducing confusion and delivering a better user experience.

✓ FIXED — requests are never forgotten. Unanswered centers are followed up on until the booking is resolved (no more "one-and-done"), and every request that stalls escalates to a human with reminders until it is closed out.

✓ FIXED — ~12h before the requested date, a confirmed customer gets an Appointment Reminder (time + center location). If the appointment was never confirmed, the customer is instead warned NOT to go to the service center — the direct antidote to being turned away
